Mission Statement

The healthcare management system we aim to create will use a database that can efficiently manage patient records, appointment scheduling, staff management, inventory control, treatment tracking, billing processes and data security. This system is going to be designed to improve healthcare operations for providers and patients by offering a single, dependable data management solution to facilitate efficient and accurate healthcare management.

Mission Objectives

1. **Patient Record Management:** Maintain accurate patient records, including demographics, medical history, and insurance information.
2. **Appointment Scheduling:** Schedule and track appointments between patients and providers while preventing conflicts.
3. **Staff Management:** Store and update staff information including: roles, departments, specializations, and work schedules.
4. **Inventory Control:** Monitor medications and medical supplies, tracking stock levels and identifying items that need to be reordered.
5. **Treatment Tracking:** Record diagnoses, treatments, and prescriptions associated with each patient.
6. **Billing Processing:** Generate bills, record payments, and link charges to the treatments.
7. **Data Security:** Protect sensitive patient and staff information through access controls based on user roles, supporting privacy and regulatory compliance.
